

## One Card, Many Possibilities

**For Dalmina Hotel, Signature RFID locks and a Mifare card represented the obvious choice. The multi-application card makes possible seamless integration of various other applications vitally contributing to the hotel's overall performance. Spica's Time&Space is one such application that enhances time management, organization and planning.**

Dalmina is a new business hotel in Split, Croatia, with 54 modern rooms, a congress hall, a meeting room and a number of other amenities aimed at offering business travelers superb services and a comfortable stay.

Guest rooms feature VingCard Signature RFID locks. While ensuring ultimate security, these stylish satin chrome locks also blend in perfectly with the modern interior. Signature locks have been designed with the guest's convenience in mind, so they provide an optimal balance between high security requirements and ease of use. The room lock system is supported by VingCard Vision software. With an intuitive graphical interface, menu-driven software and defineable user-groups, VISION ensures flexible access management control.

Toni Grcic, the general manager of Dalmina, had no doubts when deciding on technology that underlies the room lock system.

*"All modern businesses select IT solutions with an eye on the future. This means that they seek not only to satisfy the immediate needs, but also to create a system that will easily accommodate future requirements and guest expectations. The RFID platform is a logical bridge to next generation solutions."*

Toni Grcic, the general manager of Dalmina

The priority task of every hotel management is to ensure maximum comfort and a pleasant environment for guests. At Dalamina, they are well aware of the importance of good organization and planning in achieving this goal. Spica Sustavi's wealth of experience in the time management field was a valuable help in this segment. Neven Ruskovic, the general manager of Spica Sustavi, VingCard's long-time partner in Croatia, explains the advantages of a time management system in a hotel environment.

*"The scalable and modular design of Spica's Time&Space enables us to integrate it easily with any IT system. So despite its complexity, you can think of it as a valuable add-on that greatly contributes to your overall efficiency whatever your priority tasks are. Of course, in dynamic environments where flexible planning is of vital importance, the benefits of such a system are even more obvious."*

Neven Ruskovic, Spica Sustavi

# TIME SPACE

Spica's time management solution provides an excellent insight into the structure of working time, making planning and scheduling an easy task. This leaves the hotel staff with more time to dedicate to guests and their demands.

*"By effectively combining Spica's Time&Space with VingCard locks and accessories, we have created not only a comfortable and relaxed environment for guests, but also an optimal working environment for hotel employees. Both guests and room staff use Mifare cards to open rooms and automatic barriers protecting the hotel's parking lots. With all point-of-sale counters within the complex being equipped with RFID card readers, guests can also use Mifare cards for cashless payments. Furthermore, hotel employees use them to clock in working time. So this is truly a one-card: multiple-solution approach saving time and money,"* says Ruskovic.

Dalmina has three separate parking lots. In order to eliminate any bottlenecks during busy period and to speed up the access granting procedure, Spica provided an ingenious solution utilizing BOX20 access control terminals with RFID readers and RFID SOC. The guests may open the barriers using the mobile phone or the Mifare card (RFID SOC). BOX20 terminals are used by employees and outsourced service staff (delivery etc.). The periods during which specific types of users can access the parking lot are user defineable.
